

Asterisk HazMat Spillage Kit

The Asterisk HazMat Spillage Kit, developed by COSEM, is an innovative chemical resistant product which could be effectively used to cover and contain leaking chemical drums and containers of 200 litres capacity at the maximum. It is a revolutionary substitute for conventional overpack drum that is bulky and cumbersome to manoeuvre and takes up unnecessary storage space. This highly compact, portable, soft yet durable spillage kit prevents the escape of toxic liquids, thus averting hazard exposure to both the general populace and the environment.

Specifications:

Materials : Made of butyl rubber which has excellent impermeability to gases weathering and heat resistance.

Resistant to common chemicals including acids, bases and organic solvents.

Imbiber beads placed on inner layer quickly absorbs liquid runoff resulting in total containment of such liquid which cannot escape once 'imbibed'

Benefits : Storage space is only 15cm in length as opposed to the conventional overpack drum which is about 90cm.

The Asterisk HazMat Spillage Kit simply requires a one-man operation.

Above all, it involves a cost saving of at least 75% as compared to the conventional overpack drum.
